

Measuring the Impact of Digital Skills Training on Youth Employment Outcomes in Nigeria

An NGO Monitoring and Evaluation Dashboard for Tracking Training Participation, Engagement, and Employment Outcomes

BUSINESS PROBLEM

A nonprofit organization providing digital skills training across Nigeria struggles to evaluate whether its programs are improving youth employment outcomes and participant engagement across different regions.

As a result:

- Leadership cannot identify which programs drive the strongest employment outcomes.
- Management cannot determine factors influencing training completion.
- Donors lack visibility into regional program impact.
- The organization cannot effectively allocate resources to underserved areas.

The NGO needs a centralized analytics solution to evaluate program performance, participant engagement, and employment outcomes to improve decision-making and maximize social impact.

KEY INSIGHTS AND FINDINGS

What drives the program success and employment outcomes?

Participants Journey

Nearly half of the participants Secured employment after completing the digital skills training

Digital Marketing and Cloud Computing Produced the Highest Employment Outcomes

Web Development and Cybersecurity Delivered the Highest Salary Outcomes

Family Commitments Are the Leading Cause of Program Dropout

South East Achieved the Strongest Employment Outcomes Despite Lower Participation

More Participants Do Not Necessarily Lead to Better Employment Outcomes

The South West recorded the highest participant enrollment of 739, yet the South East which recorded 481 achieved the strongest employment outcomes of 51.14%, suggesting that the program effectiveness may depend on factors beyond participant volume alone.

RECOMMENDATION AND NEXT STEPS

Communicate program value earlier within the first 2 weeks to reduce dropouts.

Strengthen support for Web Development and Cybersecurity tracks to improve employability while leveraging their high salary potential. Although fewer participants from these tracks secure jobs, but those who do, earn significantly more. Mentorship, employer partnerships, and curriculum alignment can help more to succeed.

Replicate successful practices from the South East region across other regions. Despite lower enrollment, the South East achieved the strongest employment outcomes, showing that effectiveness depends on program quality, not just numbers.

CONCLUSION

Digital skills training is creating positive employment outcomes for Nigerian youth. By expanding high-performing programs, reducing dropout barriers, and increasing support in underserved regions, the NGO can further improve its social impact.

Scale Digital Marketing and Cloud Computing tracks to maximize employment outcomes. These courses produced the highest job placements, so enrollment and resources should be expanded here.

Introduce flexible learning options to reduce dropout caused by family commitments. Remote learning and adaptable schedules will keep more participants engaged.

Focus on program quality rather than participant volume. More participants do not automatically lead to better outcomes; resources should prioritize effectiveness.

Expand employer partnerships to align training with labor market demand. Stronger collaboration with companies will ensure that participants are trained in skills that match available jobs.
